

3110 Project #2 Guidelines

For the second project, the following guidelines apply. In general, we are looking for a project that demonstrates all the skills in Bootstrap and javascript we discussed during the month of October. Extra time can be taken to complete this exercise, if needed.

1. Bootstrap css
2. A form page, with many text inputs
3. A content page, with large card type divs
4. Javascript which responds to input and manipulates the DOM, via
 - a. `getElementById()`
 - b. `createElement()`
 - c. `appendChild()`
5. Several pages might be deployed, where links, divs or paragraphs are created, based on some input into your text inputs, per **phase 1 javascript**, in our github.

React.js is not required, but if you are using it, special consideration will be given.

Experimentation and continued development using React will be considered, if you have chosen to do more with React.

Pages and sites need not be deployed to the web, at this time. We will do more with deployment, AWS S3 and static web development in the next project.

Projects should be shown to the instructor, and no videos are required, except in the case of exceptional work, where a video is appreciated.
